

# Desarrollo FrontEnd con JavaScript

s03 – Cargando módulos con RequireJS

Programación modular

Carga eficaz de archivos

# RequireJS

Estructura para aplicaciones  
grandes

Código reusable

# Antes de RequireJS

```
<script type="text/javascript"  
src="user.js"></script>
```

```
<script type="text/javascript"  
src="users.js"></script>
```

```
<script type="text/javascript"  
src="main.js"></script>
```

# RequireJS - HTML

```
<script data-main="lib/require/main"
src="lib/require.js"></script>
<script type="text/javascript">
  requirejs.config({
    urlArgs: 'timestamp=' + Date.now()
  });
</script>
```

# RequireJS – main.js

```
require(["user"], function(User) {  
    var user = new User();  
  
    user.set('email', 'gustavo@xenda.pe')  
  
    console.log(user.attributes);  
});
```

# RequireJS – user.js

```
define(function() {  
    var User = function User() {  
        this.attributes = {};  
    };  
  
    User.prototype.set = function(attr, value) {  
        this.attributes[attr] = value;  
    };  
  
    User.prototype.get = function(attr) {  
        return this.attributes[attr];  
    };  
  
    return User;  
});
```

# RequireJS – users.js (cargando módulo)

```
define(["user"], function(User) {  
    var Users = function Users() {  
        this.collection = [];  
    };  
  
    Users.prototype.add = function(user) {  
        if (user instanceof User) {  
            this.collection.push(user);  
        }  
    };  
  
    return Users;  
});
```

# RequireJS – main.js (más de un módulo)

```
require(["user", "users"], function(User, Users) {  
    var user = new User();  
    var users = new Users();  
  
    user.set('first_name', 'Gustavo');  
    user.set('last_name', 'Leon');  
    user.set('email', 'gustavo@xenda.pe');  
  
    users.add(user);  
  
    console.log(users.collection);  
});
```
